Since Moodle doesn't allow skipping major versions during the upgrades we had to perform upgrades from version to version.

We initially upgraded to Moodle 4.1.21+ and here are the steps we followed:

- Moved all files/directories from the public_html to tmp/moodle directory.
- Downloaded the Moodle 4.1.21+ zip file from https://download.moodle.org/releases/security/ inside the public_html directory.
- Unzipped the downloaded file and copied the config.php from tmp/moodle to the public_html directory.
- Enabled the Maintenance mode with this command: php admin/cli/maintenance.php --enable
- Went inside the theme directory and downloaded the Moove theme zip file for the corresponding Moodle version and extracted it there. The zip file was downloaded from here: https://moodle.org/plugins/theme_moove/versions
- Then used these commands to perform the upgrade: php admin/cli/upgrade.php --non-interactive
  php admin/cli/upgrade.php
- Purged cache with this command: php admin/cli/purge_caches.php
- Disabled Maintenance mode: php admin/cli/maintenance.php --disable

Then we upgraded to Moodle 4.4.11+ and then to Moodle 4.5.7+ with the same steps.

The upgrade to Moodle 5.1 required PHP 8.2 so went ahead and upgraded the PHP version to 8.2.

- Downloaded the Moodle Moodle 5.1 zip file from here: https://download.moodle.org/releases/latest/
- The moove theme was downloaded from here: https://moodle.org/plugins/theme_moove/versions
- Since the webroot of Moodle 5.1 is public_html/public so we updated the webroot from the Application Settings tab to public_html/public.
- We copied the config.php file and ran the commands in this order:

  php admin/cli/maintenance.php --enable
  php admin/cli/upgrade.php --non-interactive
  php admin/cli/upgrade.php
  php admin/cli/purge_caches.php
  php admin/cli/maintenance.php --disable
